

Sand Brook Syncline Exercise

Structural data for this exercise are from eight field stations in the syncline, highlighted on the map with field stations and labels. The structural data from these stations are summarized on the next page.

[Flemington2012a.KMZ](#)

| ID | STATION | | TYPE | STRIKE | DIP | DIR | DIP | DIPAZM |
|----|---------|------|------|--------|-----|-----|-----|--------|

| 24 | 67055 | TRL | F | 9 | 77 | W | 77 | 279 |

There are 8 bedding readings and 24 fracture readings in this tabular data set.

Copy and past the DIP and DIPAZM data into Notepad if you using windows or a text editor using a Mac. Save the files for input into a separate text file to open in the stereonet software .

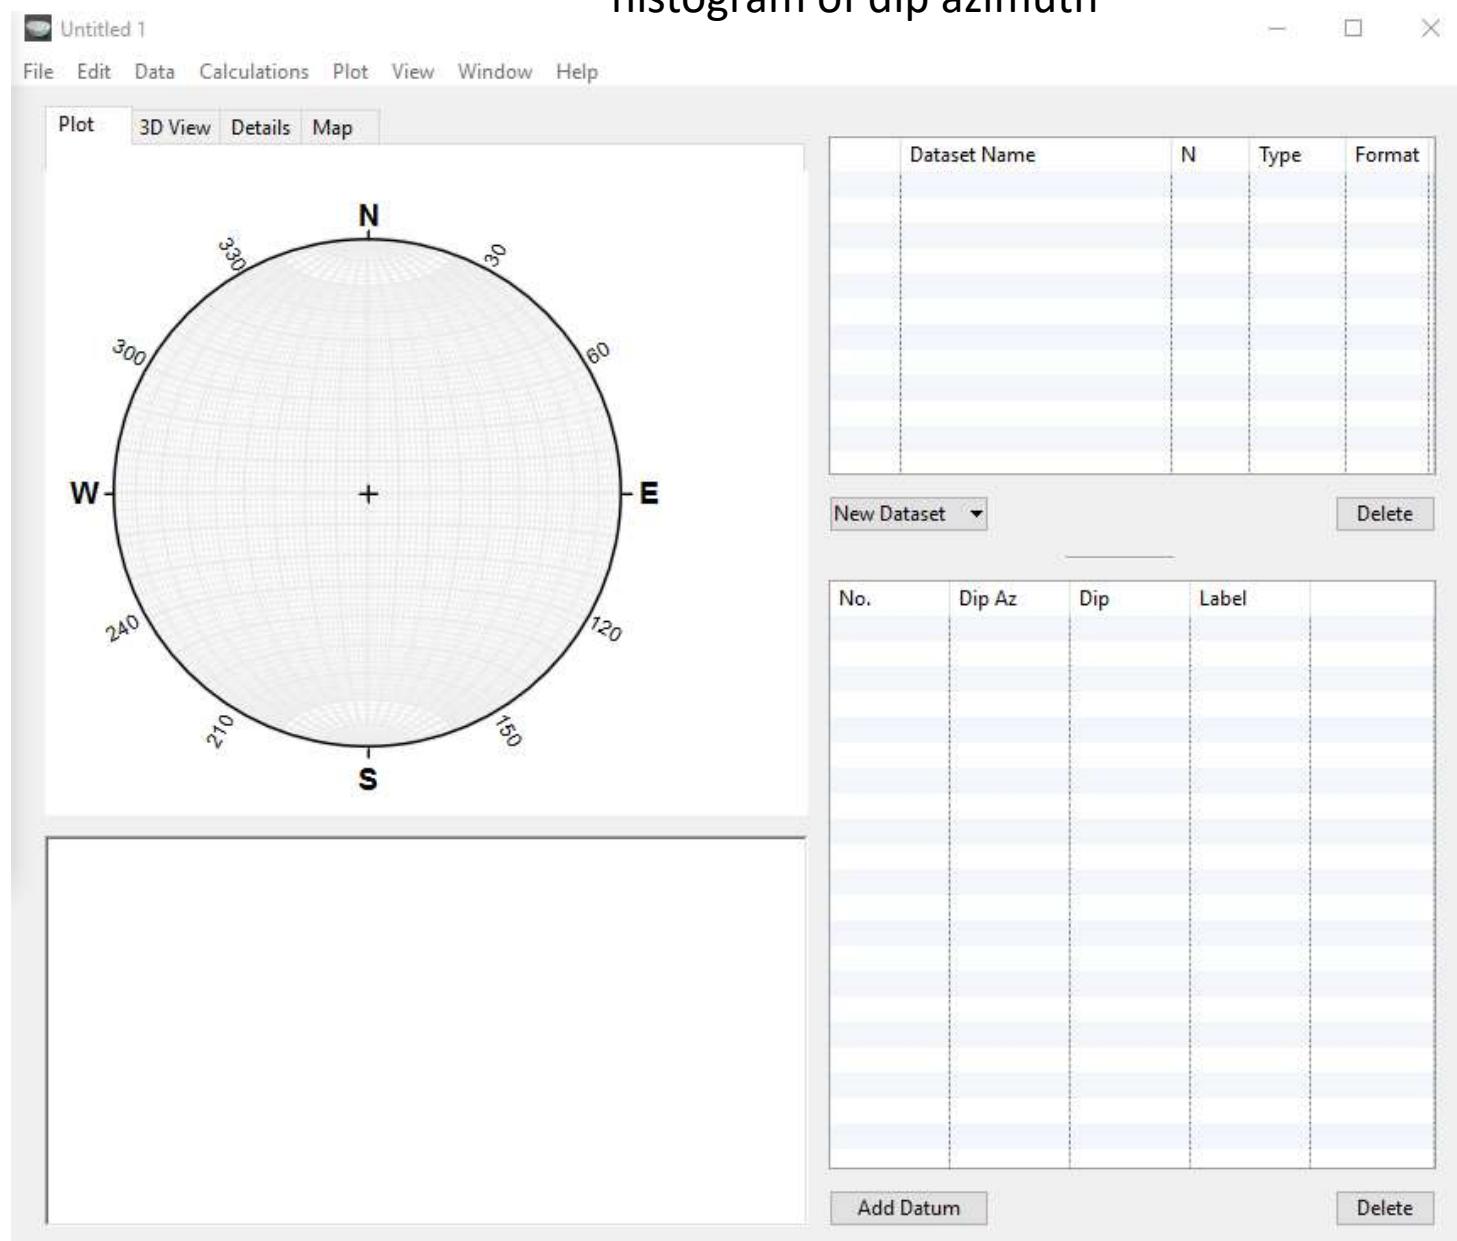

The goal is to generate graphic images of the bedding and fracture statistics and fold axes using circular histograms and equal-area stereonet projections.

Variations in plot style include cyclographic and circular-histogram plots of the bedding and fractures as demonstrated on the following pages.

Sand Brook Syncline Beds

Showing cyclographic plot and circular histogram of dip azimuth

- 1) Start with a blank plot.
- 2) <File><Import Text File>

Sand Brook Syncline Beds

Showing cyclographic plot and circular histogram of dip azimuth

- 1) Start with a blank plot.
- 2) <File><Import Text File>
- 3) Parse Text Data for
<Planes> and <Assign
Columns> for Dip Dir (1)
and Dip (2). And Press
<Okay>.

Parse Text Data

Stereonet does not recognize the format of this text file. The file has been parsed into rows and columns.

| Row # | 1 | 2 | 3 |
|---------------------------------------|-----|----|---|
| <input checked="" type="checkbox"/> 1 | 300 | 36 | |
| <input checked="" type="checkbox"/> 2 | 210 | 17 | |
| <input checked="" type="checkbox"/> 3 | 319 | 27 | |
| <input checked="" type="checkbox"/> 4 | 335 | 35 | |
| <input checked="" type="checkbox"/> 5 | 271 | 40 | |
| <input checked="" type="checkbox"/> 6 | 309 | 30 | |
| <input checked="" type="checkbox"/> 7 | 307 | 27 | |
| <input checked="" type="checkbox"/> 8 | 355 | 27 | |

Data type: **Planes** Decimal pt: . 1st row with data: 2

Strike, Dip Dip Dir, Dip

Assign Columns

| | | | | | |
|----------------|---|------------|--|--------|--|
| Dip Direction: | 1 | Longitude: | | Time: | |
| Dip: | 2 | Latitude: | | Day: | |
| | | Elevation: | | Month: | |
| | | Notes: | | Year: | |

If your entire date is in a single column (e.g., 6/21/17), assign that column to "Year".

Cancel **Okay**

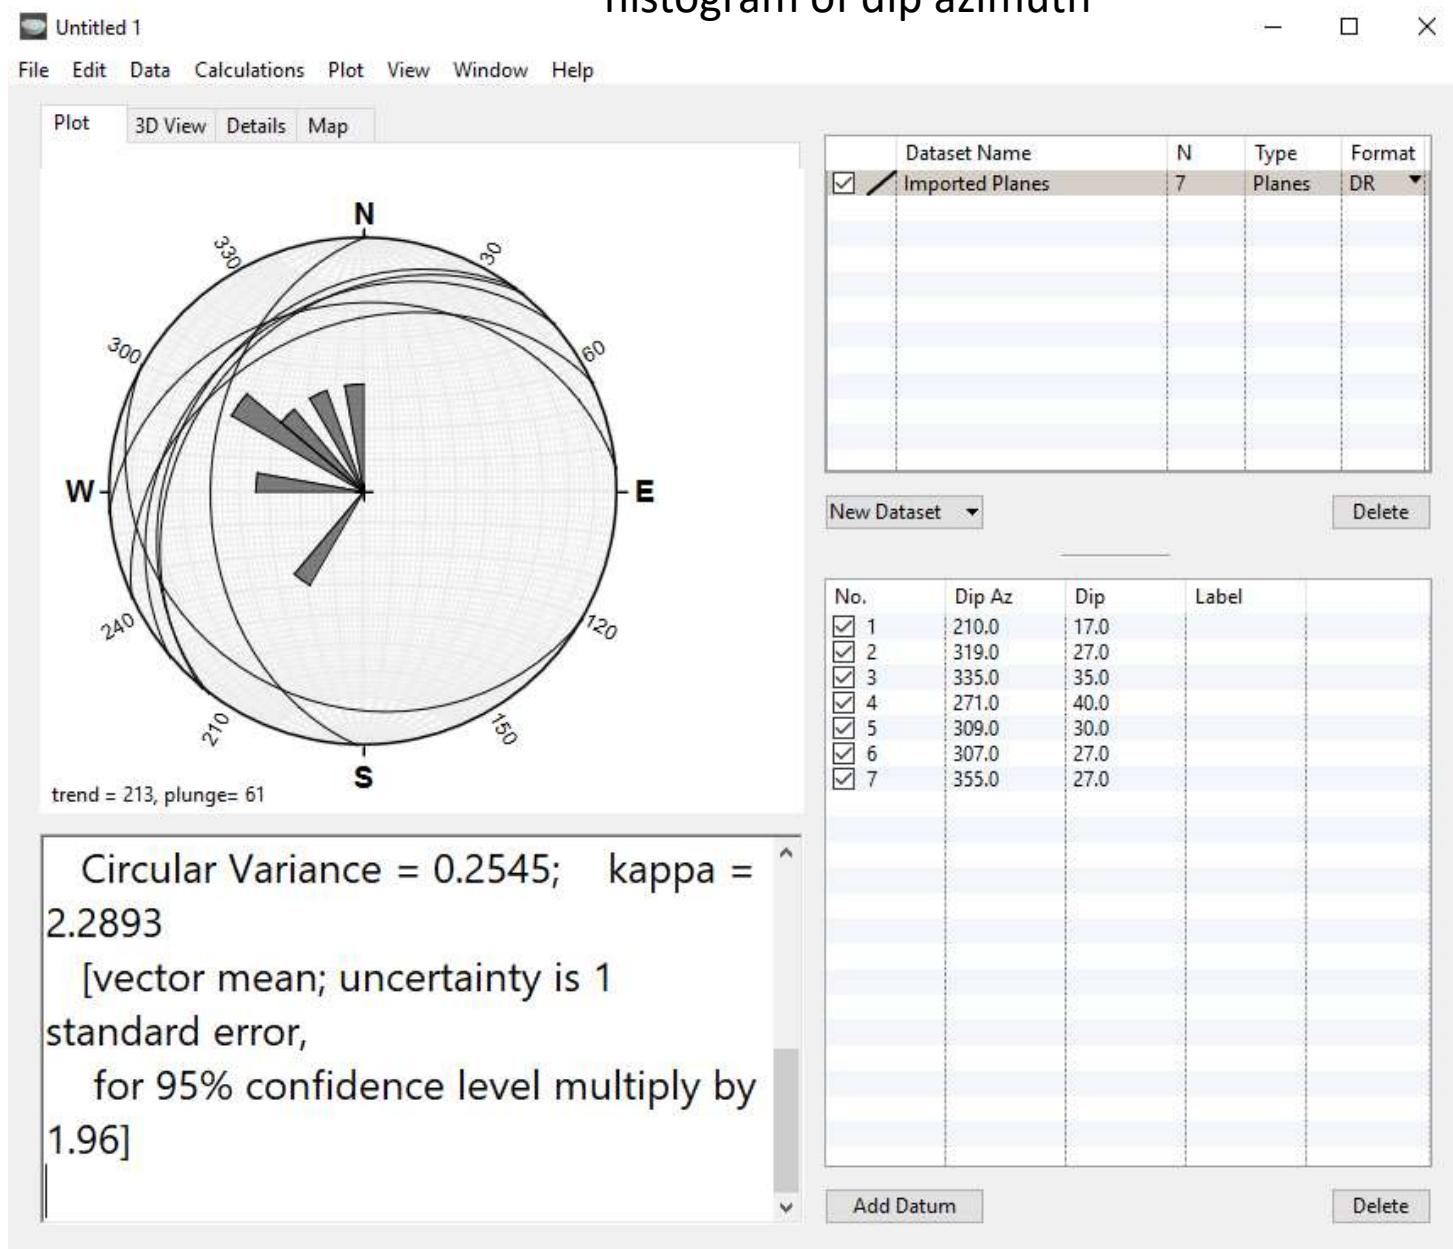

Sand Brook Syncline Beds

Showing cyclographic plot and circular histogram of dip azimuth

- 1) Start with a blank plot.
- 2) <File><Import Text File>
- 3) Parse Text Data for <Planes> and <Assign Columns> for Dip Dir (1) and Dip (2). And Press <Okay>.
- 4) <Plot> <Rose Diagram> <imported Planes>
- 5) Enlarge the histogram bins by checking <scale by area> in the <View> <Inspector>

Inspector

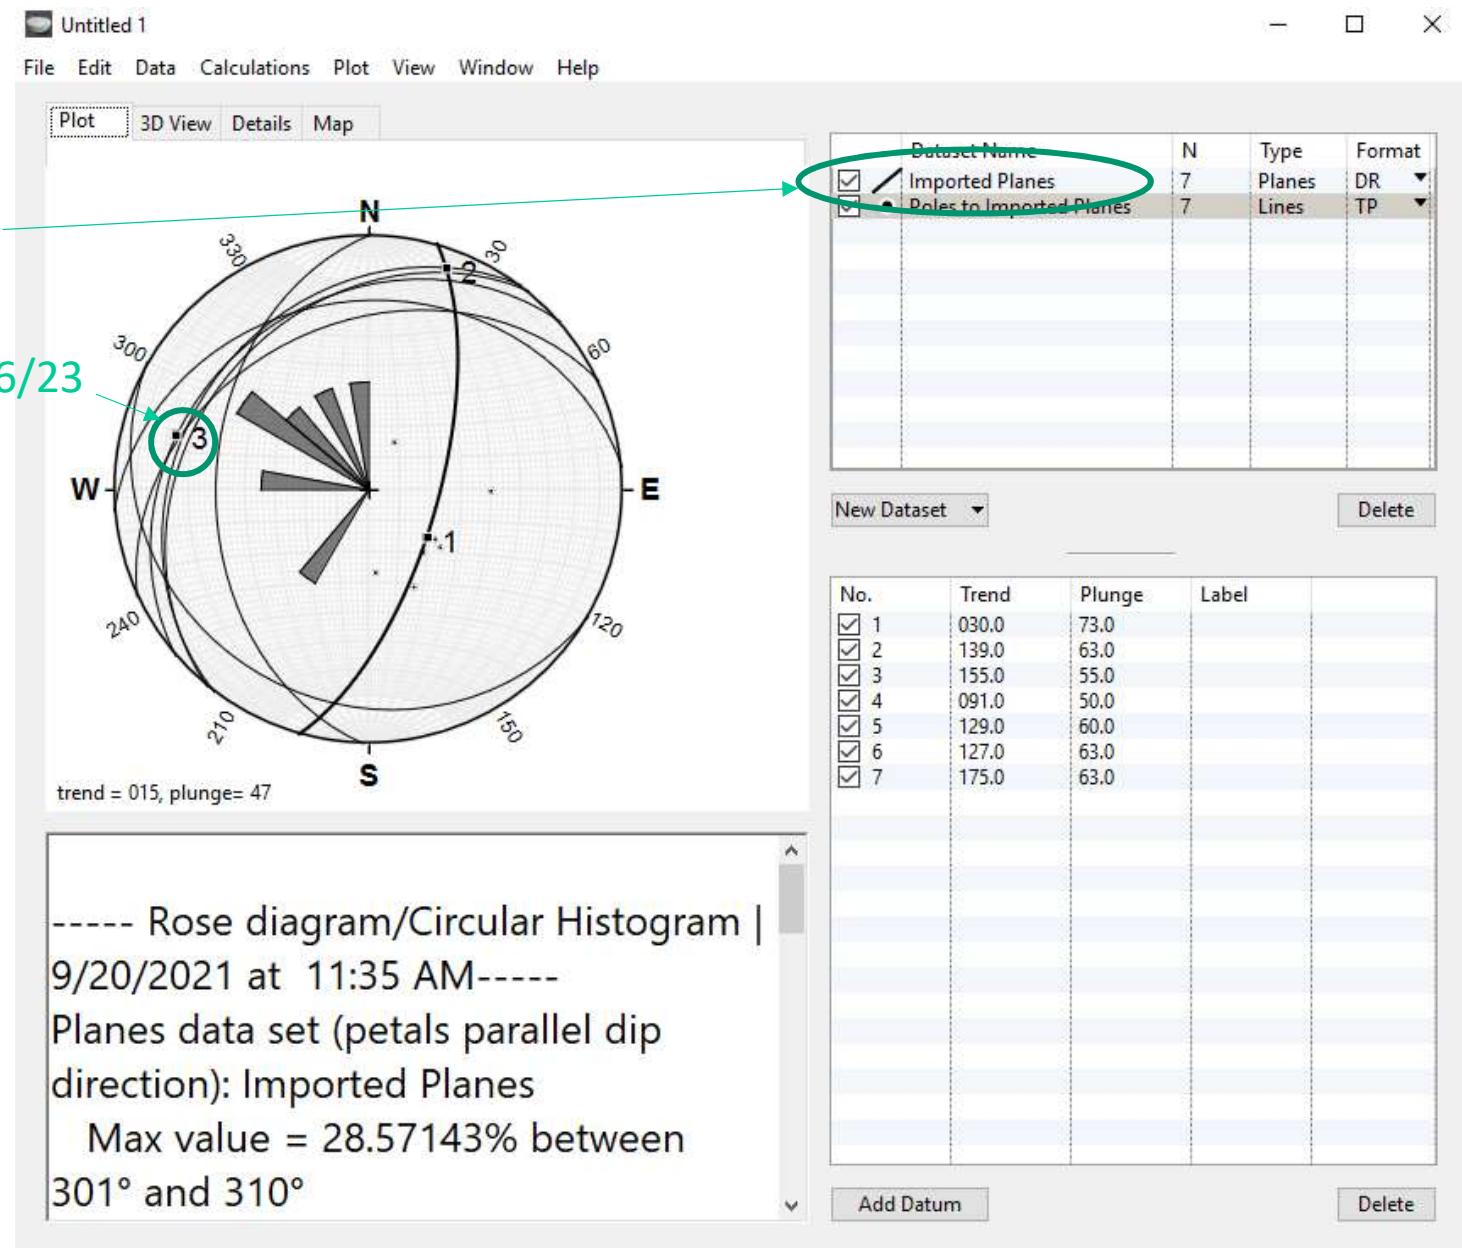

- Stereonet Datasets Analyses Contours
- Bingham Axes**
 - Size: 6 Color:
 - Eigenvectors to plot: All vectors
- Mean Vector**
 - Size: 6
 - plot negative & positive plunges separately
 - negative mean vector in lower hemisphere
- Rose Diagram**
 - Bin size: 10° Color:
 - Value (in % of total) of perimeter: 80
 - center bin on zero
 - show mean vector
 - half circle rose
 - treat data as axes
 - scale by area

Sand Brook Syncline Beds

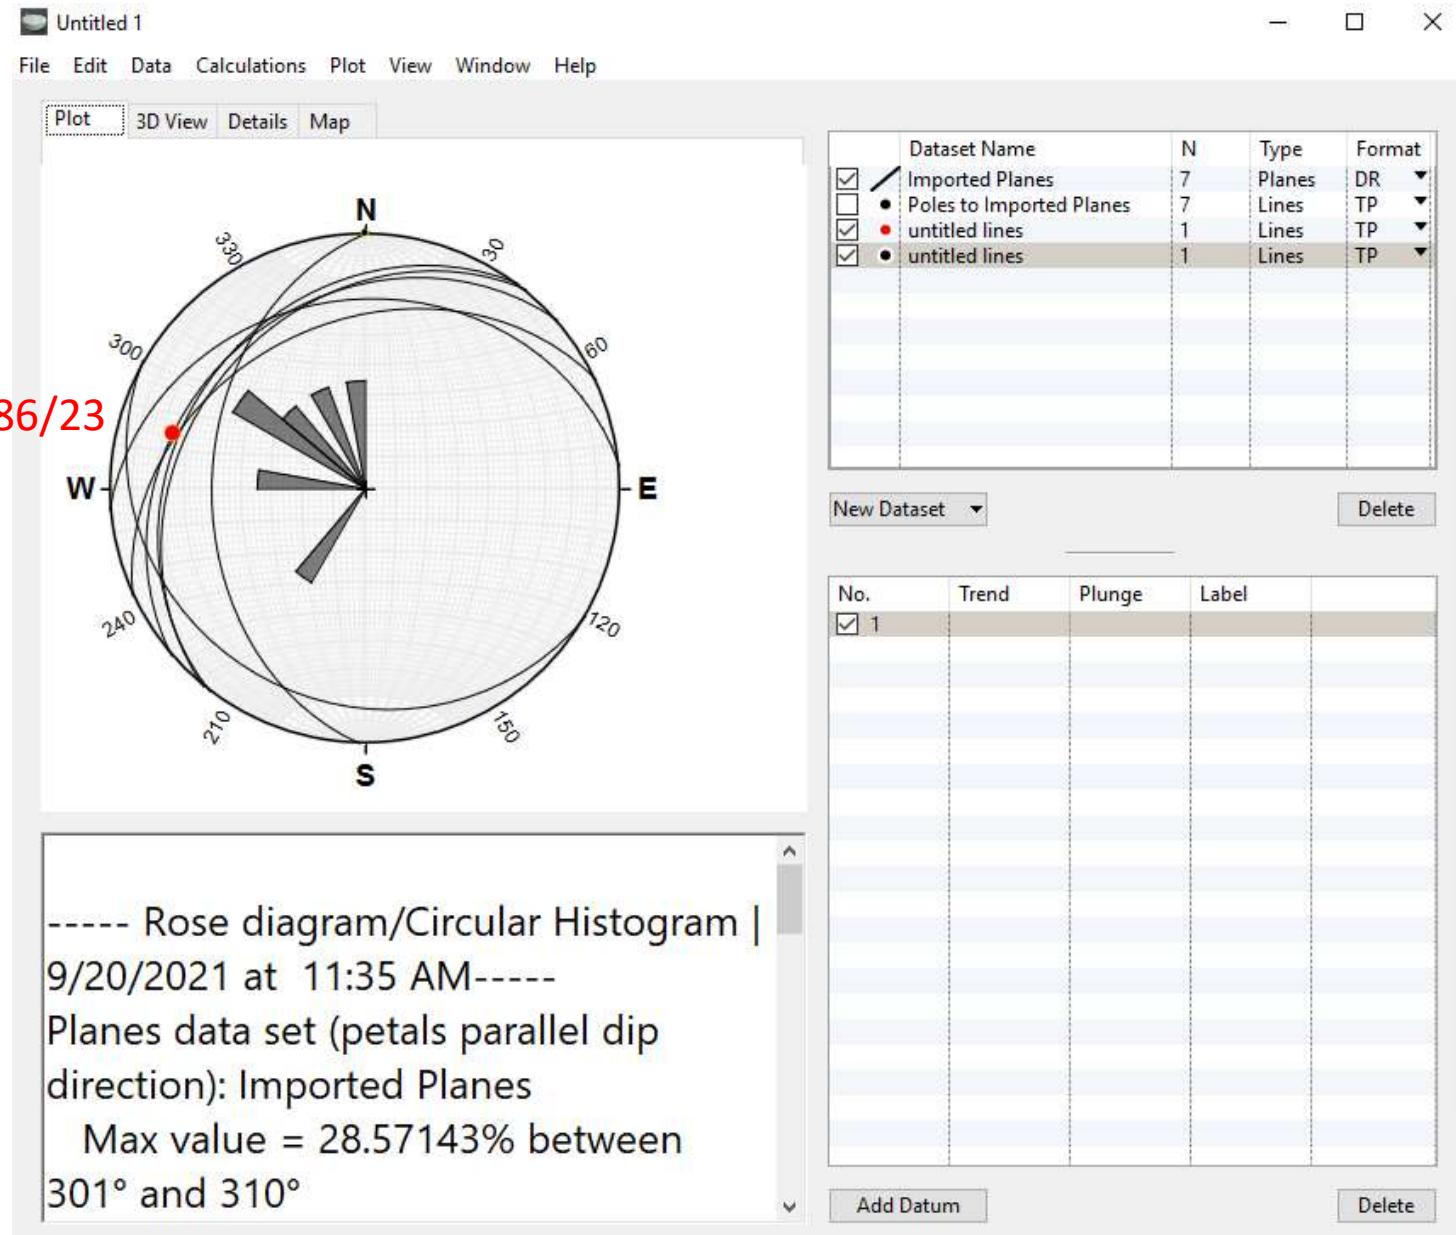

Showing a fold-axis solution .

- 1) To derive a fold-axis solution, first <Calculations> <Poles> making sure that the Imported Planes Dataset is selected and highlighted.
- 2) Next, find a solution to the fold axis with $\sim 286/23$ <Calculations> <Axial Plane Finder...>. Make sure that the Poles to Imported Planes Dataset is active and highlighted.
- 3) Turn off (uncheck) the Poles Dataset
- 4) Add the Fold axis by itself to unclutter the plot: <Data> <New Dataset> <Lines> <New Datum Entry> and type in the value 286/23.
- 5) Use the <View> <Inspector> to change the size and color of the point.

Sand Brook Syncline Beds

Showing a 'cleaned-up' fold-axis solution

Sand Brook Syncline Fractures

Repeat the process for fractures, but not including the fold axes step.

- 1) Repeat first to generate the cycographic plot and the poles to the planes.
- 2) Derive maximum contours and manually pick out the three most common planes having the highest-percentage contours:
 <Plot> <Contours> <Poles to imported planes>
- 3) Make sure that within the <View> <Inspector> <Contours> Tab that the <1% Area contours> radio button is chosen.

Inspector

Stereonet Datasets Analyses Contours

apply correction

Trend: 9 Plunge: 0

maximum correlation factor: 2

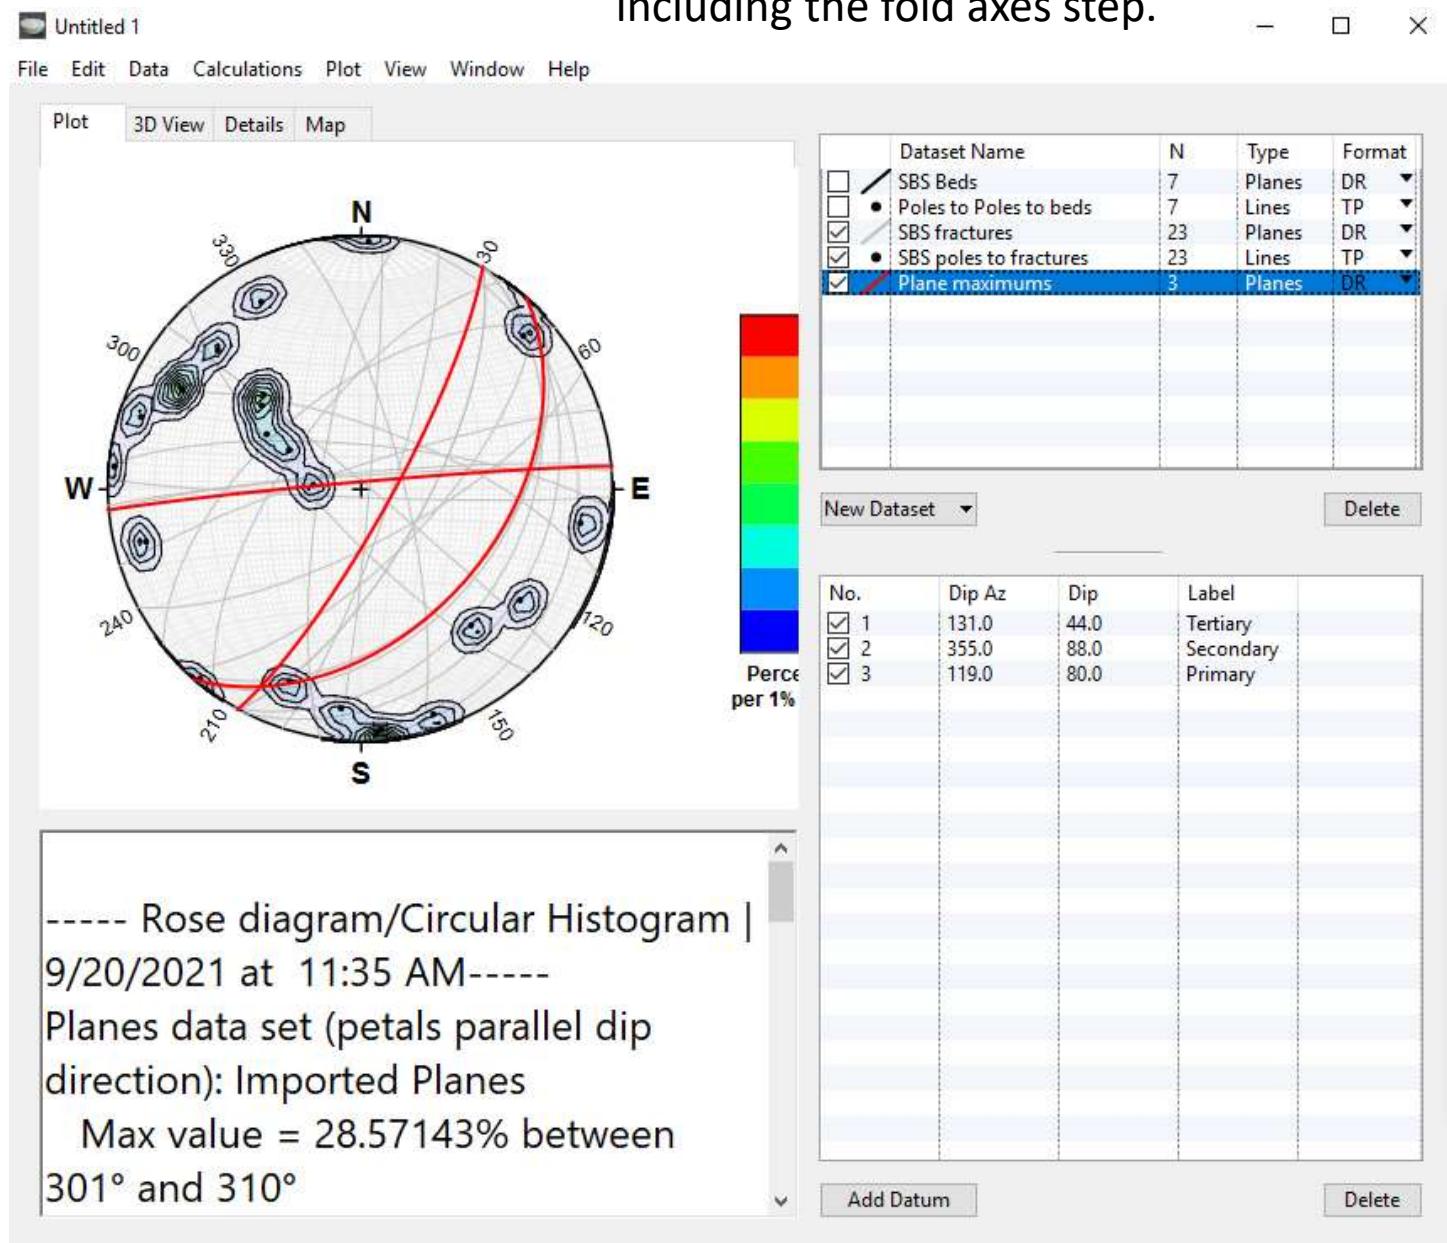

Sand Brook Syncline Fractures

Repeat the process for fractures, but not including the fold axes step.

- 1) Use the <Inspector> to change the cyclographic plot to light gray and then extract three of the most common, representative planes determined using the contours.
- 2) Remember that the center of each contour cluster is the pole to the plane, and therefore you must take the supplement to the extracted plunge ($xxx-180 < 360$) and the compliment of the dip ($xx - 90 > 90$)
